

Assumptions: macOS configurator for the SMK-68; macros live alongside layers and are flashed to the board, so every screen shows sync state. Two macro kinds coexist → recorded keystroke sequences with real timing, and condition-aware flows. **Open:** I could not reach the attached `smk_configurator` folder, so type, palette and component vocabulary here are my own → send a screenshot or re-attach and I'll re-skin to match.

14 Macro library → device-rooted list, sync state always visible

↵

Drag a block edge to change hold time · drag the gap between blocks to refine · ⌘-drag to duplicate

Normalize all gaps → 20 ms

#	EVENT	AT	HOLD	GAP
05	keydown M + ↵ + K	0 ms	210 ms	—
06	type "git commit -m "	238 ms	—	28 ms
07	keydown →	412 ms	64 ms	76 ms
08	keydown TAB	498 ms	48 ms	22 ms

PLAYBACK SAFETY

⬢

Abort if a modifier is stuck

⬢

Ignore real typing during run

Timing longer than 1 s may feel unresponsive on the board. Consider normalizing gaps.

16 Editor B → typed step list + inspector, no timeline

Build & deploy
